

The report said RM 2.0M. The data said **RM 2.8M.**

I audited three months of loan disbursement data for **Xanderia Marketing** — 272 applications, RM 5.5M applied for, RM 2.8M actually paid out — and rebuilt the numbers the team was reporting to management.

THE BRIEF

Xanderia is a personal-financing agency. I ran its paid social campaigns and owned the monthly disbursement report. The ask was simple: **prove what the advertising actually returned, and give the team a number they could trust.** The source was one workbook with a separate sheet per month, each laid out differently.

WHAT I DID

- 1 Consolidated** 272 application records from three inconsistently structured monthly sheets into one comparable dataset.
- 2 Rebuilt the status logic.** The sheets mixed “applied for” with “paid out”, inflating the headline figure by roughly 2.7×.
- 3 Audited the formulas instead of trusting them** — and found a SUM range stopping 41 rows short of the data.
- 4 Normalised geography.** October recorded districts, November and December recorded states. I mapped districts to their state so all three months could be compared on one map.

THE RESULT

272 applications analysed	RM 2,836,900 disbursed across 142 loans	52.2% application to disbursement rate	RM 54.95 returned per RM 1 of ad spend
-------------------------------------	---	--	--

All figures October–December 2025, in Malaysian Ringgit, from the client’s own workbook. Customer names, IC numbers and phone numbers removed.

MONTH BY MONTH

Month	Applications	Applied for	Paid out	Disbursed	Conversion
October 2025	49	RM 1,124,300	31	RM 767,100	63.3%
November 2025	68	RM 1,601,900	33	RM 795,200	48.5%
December 2025	155	RM 2,784,800	78	RM 1,274,600	50.3%
Q4 2025 total	272	RM 5,511,000	142	RM 2,836,900	52.2%

Conversion = loans paid out ÷ applications received.

WHAT I FOUND

01 The workbook's own total was wrong

December's TOTAL cell read =SUM(H4:H117) while the data ran to row 158. The month was understated by **RM 767,100 — 27.6% of December**. October had no TOTAL row at all. And every monthly total summed *all* statuses, so "value applied for" was being read as "value paid out".

As the sheet's TOTAL formula reported		RM 2,017,700
	=SUM(H4:H117) → stops 41 rows short	
Actual sum of the LOAN AMOUNT column		RM 2,784,800
	=SUM(H4:H158)	

December 2025, reported versus actual. Fixed to =SUM(H4:H158).

02 Half the pipeline never converts

Of RM 5,511,000 applied for, **RM 2,836,900 (51.5%) was disbursed** and RM 2,584,100 (46.9%) was rejected or cancelled. Lead volume is not the problem — applications grew from 49 to 155 across the quarter. The leak is at conversion.

Applications per month, split into those paid out and those that were not. Volume nearly tripled; the share that converts did not move with it.

03 The biggest losses are not credit failures

DSR burst from the latest ANGKASA increase is the most *frequent* reason — 45 cases. But by *value*, the single largest cause is customers walking to a competing agency: **4 cases worth RM 594,900**. That is an average of RM 148,725 per case, roughly **seven times the average application** of RM 20,261. The agency is losing its largest deals at the final step, and a case-count view hides it completely.

Customer went to a competing agency		RM 594,900
	4 cases	
DSR burst / ANGKASA increase		RM 496,400
	45 cases	
Other documented reason		RM 342,600
	14 cases	
Resubmit with a different agency		RM 326,500
	15 cases	
Customer no response or asked to cancel		RM 249,200
	13 cases	

The five largest reasons by value, out of RM 2,584,100 rejected or cancelled. A further RM 574,500 across 32 cases came from the RM 50,000 legal ceiling, employer and employment issues, bankruptcy, and cases with no reason recorded.

04 Geography decides conversion, not volume

Perak is the highest-value state at RM 466,600 — but converts at only 36.4%. W.P. Putrajaya converts at 77.8%, and Negeri Sembilan, Pahang and Melaka all sit at 70.0%. Sabah draws 32 applications and returns 40.6%.

Top 8 states by disbursed value. Conversion = loans paid out ÷ applications received.

RM 1 of advertising returned RM 54.95

RM 51,627.15 of paid social produced RM 2,836,900 in disbursed loans. Media was **1.8%** of disbursed value — RM 189.81 per application, RM 363.57 per loan paid out. At that ratio the channel is not a cost centre, it is the cheapest origination the team has.

05 The ad data had to be repaired before it could be trusted

The campaign sheet's own cost-per-click column was wrong in period 1 (RM 78.11 per click where spend ÷ clicks gives RM 0.35), and periods 2 and 3 stored their cost metrics as *text*, so they could not be summed at all. I recalculated every efficiency metric from the raw spend, impression and click columns. I also flagged that the "Result" column changes definition between periods, so only spend, impressions, reach and clicks are genuinely comparable across them.

WHAT THIS DEMONSTRATES

- Data cleaning & reconciliation
- Formula auditing
- Pivot-style aggregation
- Geographic normalisation
- Funnel analysis
- KPI design
- Data storytelling
- Stakeholder reporting

TOOLS

- Excel
- Python — openpyxl, matplotlib
- Meta Ads Manager

On the data: every figure is computed from the client's own workbook (October–December 2025). Customer names, IC numbers and phone numbers have been removed. Where the source recorded districts rather than states, districts were mapped to their state — no value was estimated, interpolated or filled in. Recruiter IDs are retained as they appear in the source file.
